

Installation Instructions

Thank you for downloading TE Tool.

Because I'm not an Apple-registered developer, macOS will show a security warning the first time you try to open it. It will recommend you move it to the trash, but instead this is how you can get it to work (you don't need to do this each time).

If you have not already, unzip the folder you received then:

1. Drag TE Tool.app into your Applications folder.
2. When you open the app for the first time, you'll likely see a message:

“TE Tool” can’t be opened because it is from an unidentified developer.

or

"macOS cannot verify the developer of “TE Tool.”

3. Open System Settings (or System Preferences on older macOS).
4. Go to Privacy & Security.
5. Scroll down. You will see a section that says:
““TE Tool’ was blocked from use because it is not from an identified developer”
6. Click Allow Anyway (or Open Anyway).
7. Go back to your Applications folder.
8. Double-click TE Tool.app again.
9. macOS will ask once more if you're sure. Click Open.

You only need to do this the first time. After that, the TE Tool should open normally.

If you have any questions or suggestions, please reach out to me,
Brandon Falk
